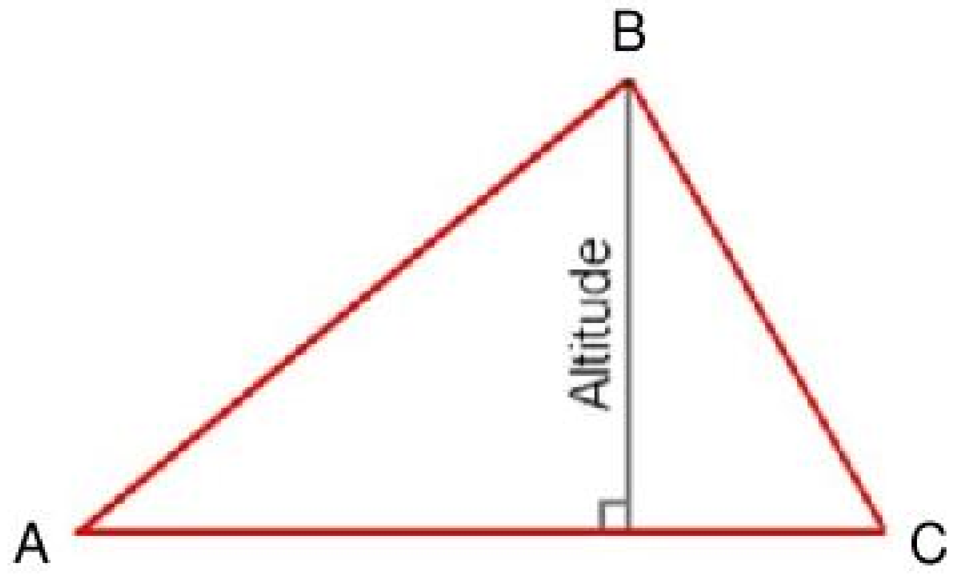
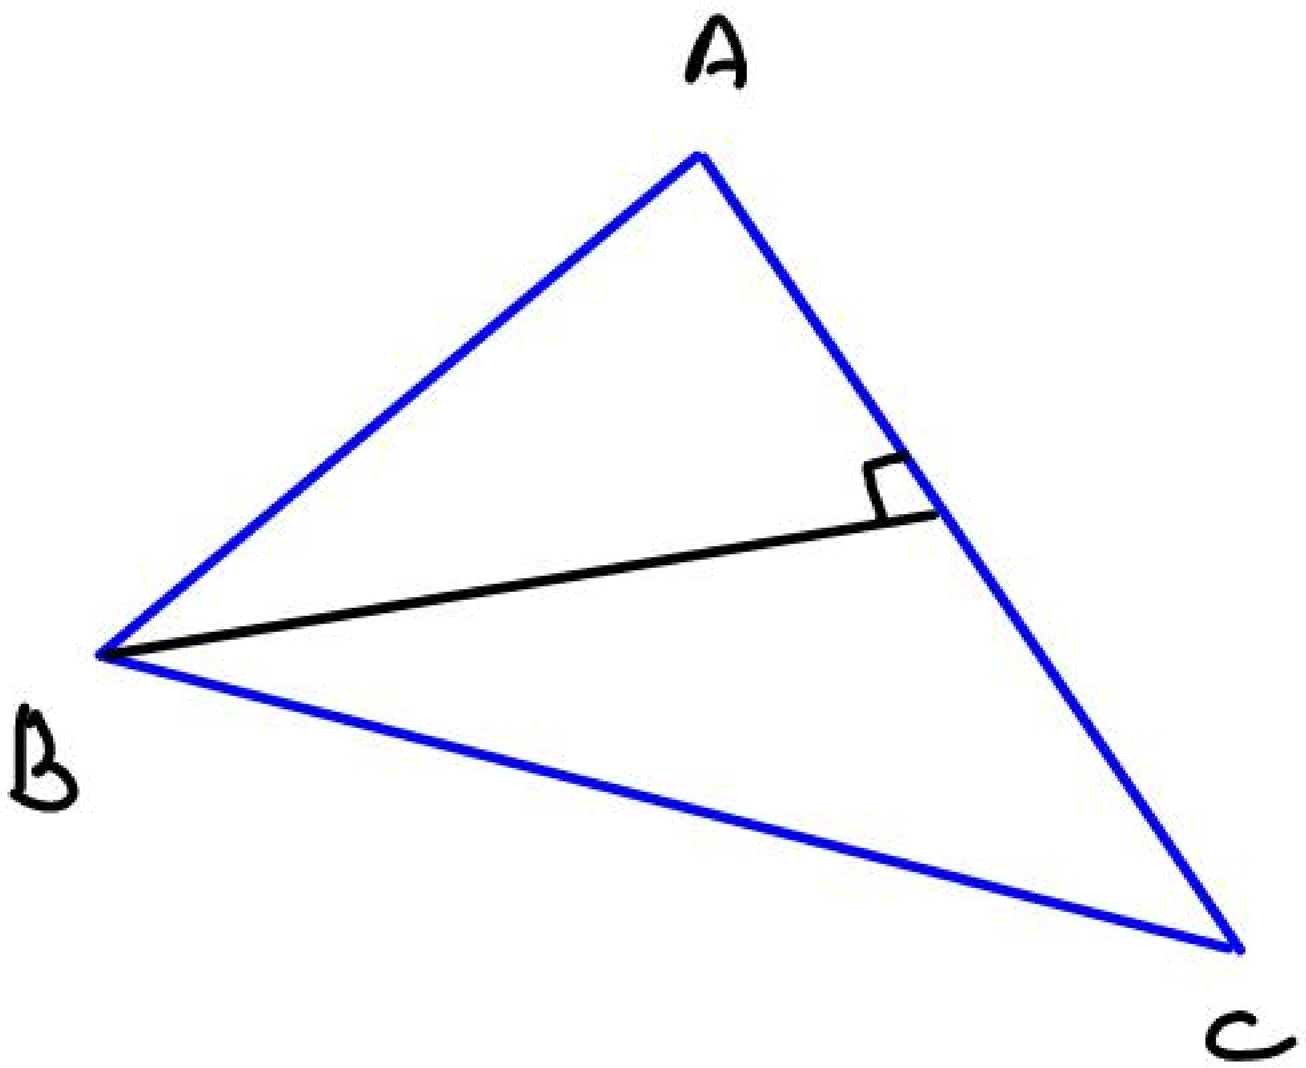
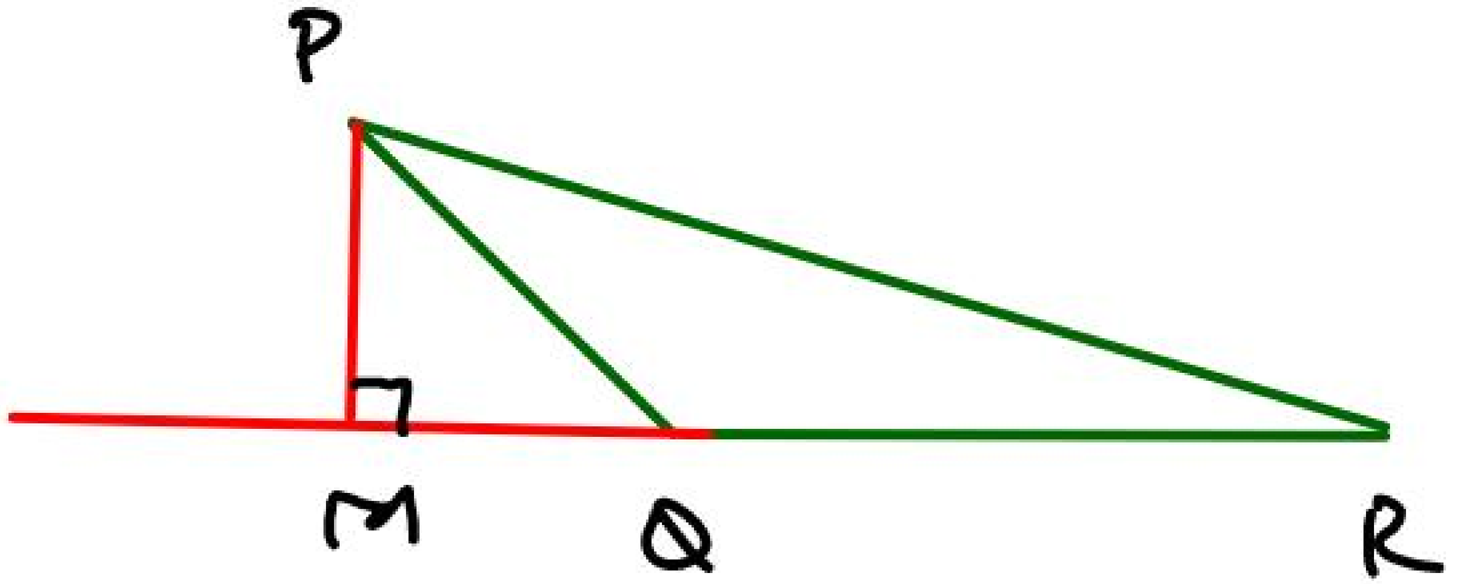
BASIC TERMS USED IN TRIANGLES

Height

(1) Altitude : Altitude of a triangle is the perpendicular drawn from the vertex of the triangle to the opposite side. Also, known as the height of the triangle, the altitude makes a right angle triangle with the base.

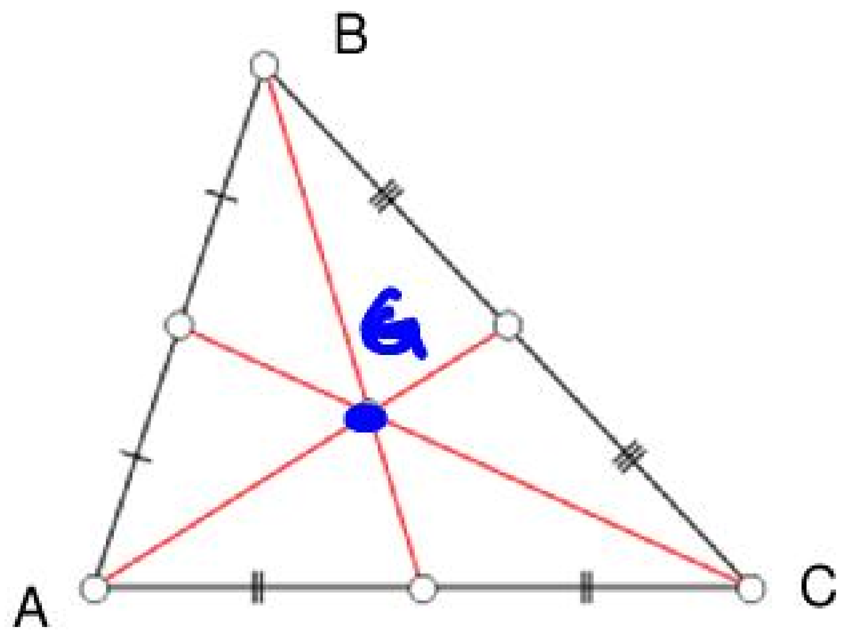




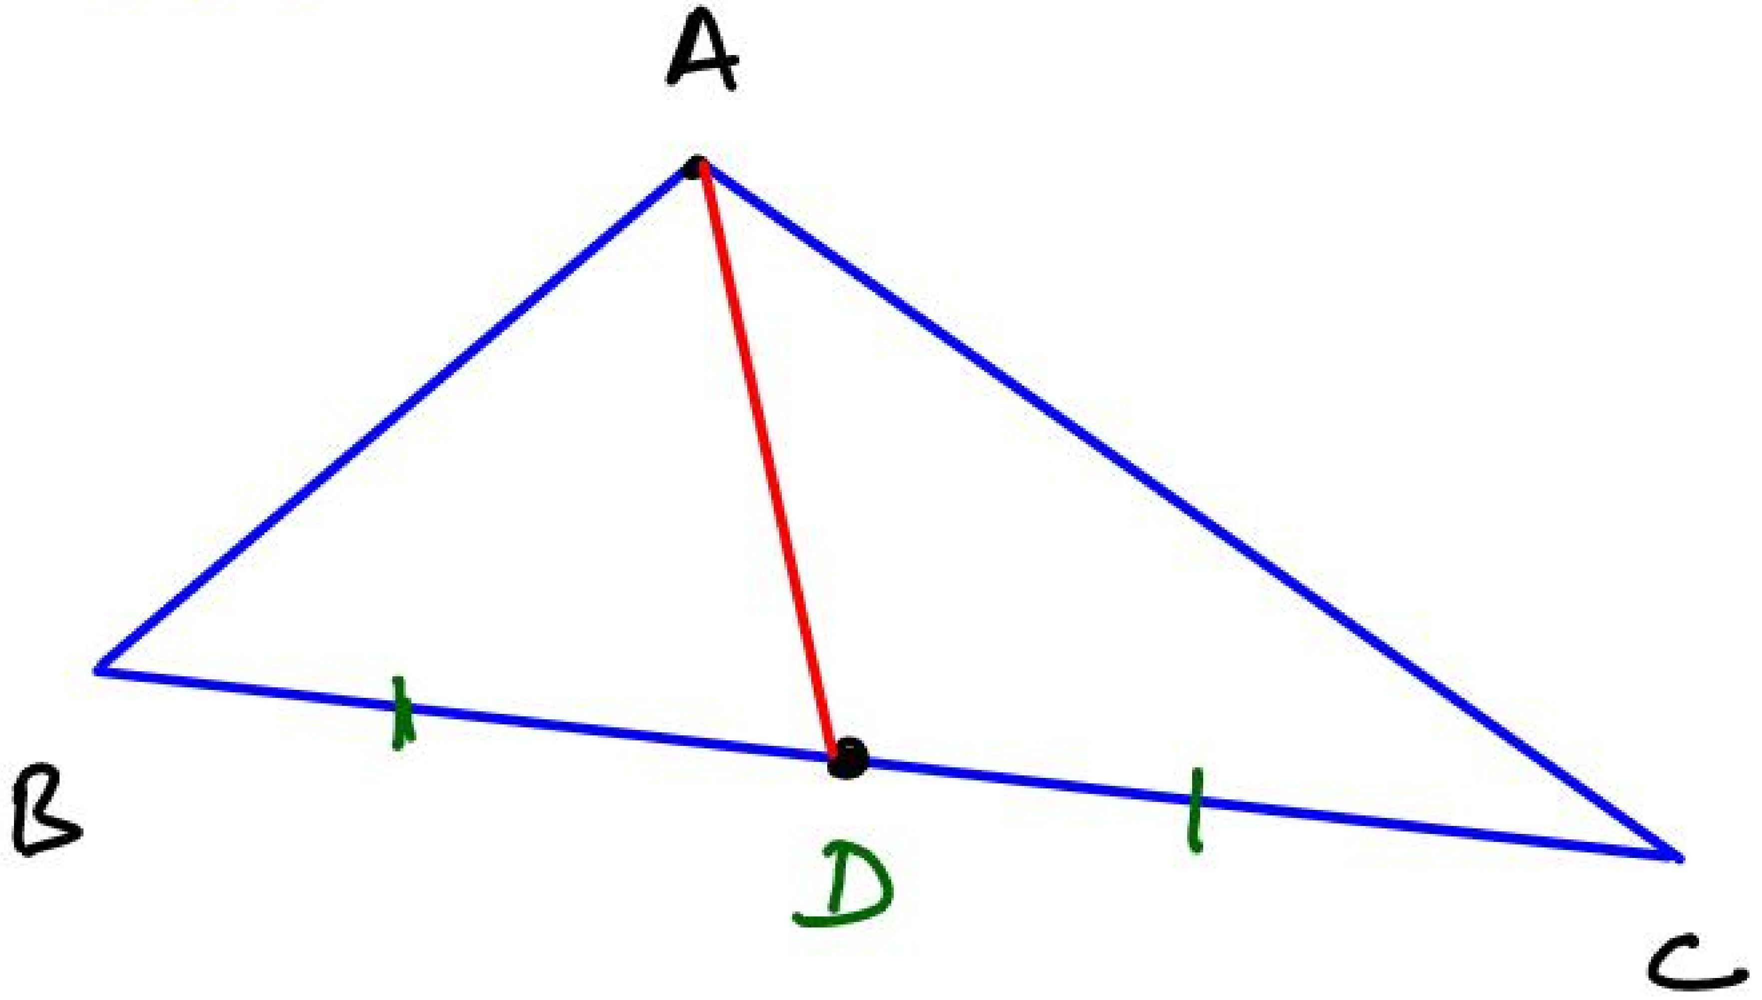


PM is altitude of ΔPQR

(2) Median : A median of a triangle is a line segment joining a vertex to the midpoint of the opposite side, thus bisecting that side. Every triangle has exactly three medians, one from each vertex, and they all intersect each other at the triangle's centroid.



Median

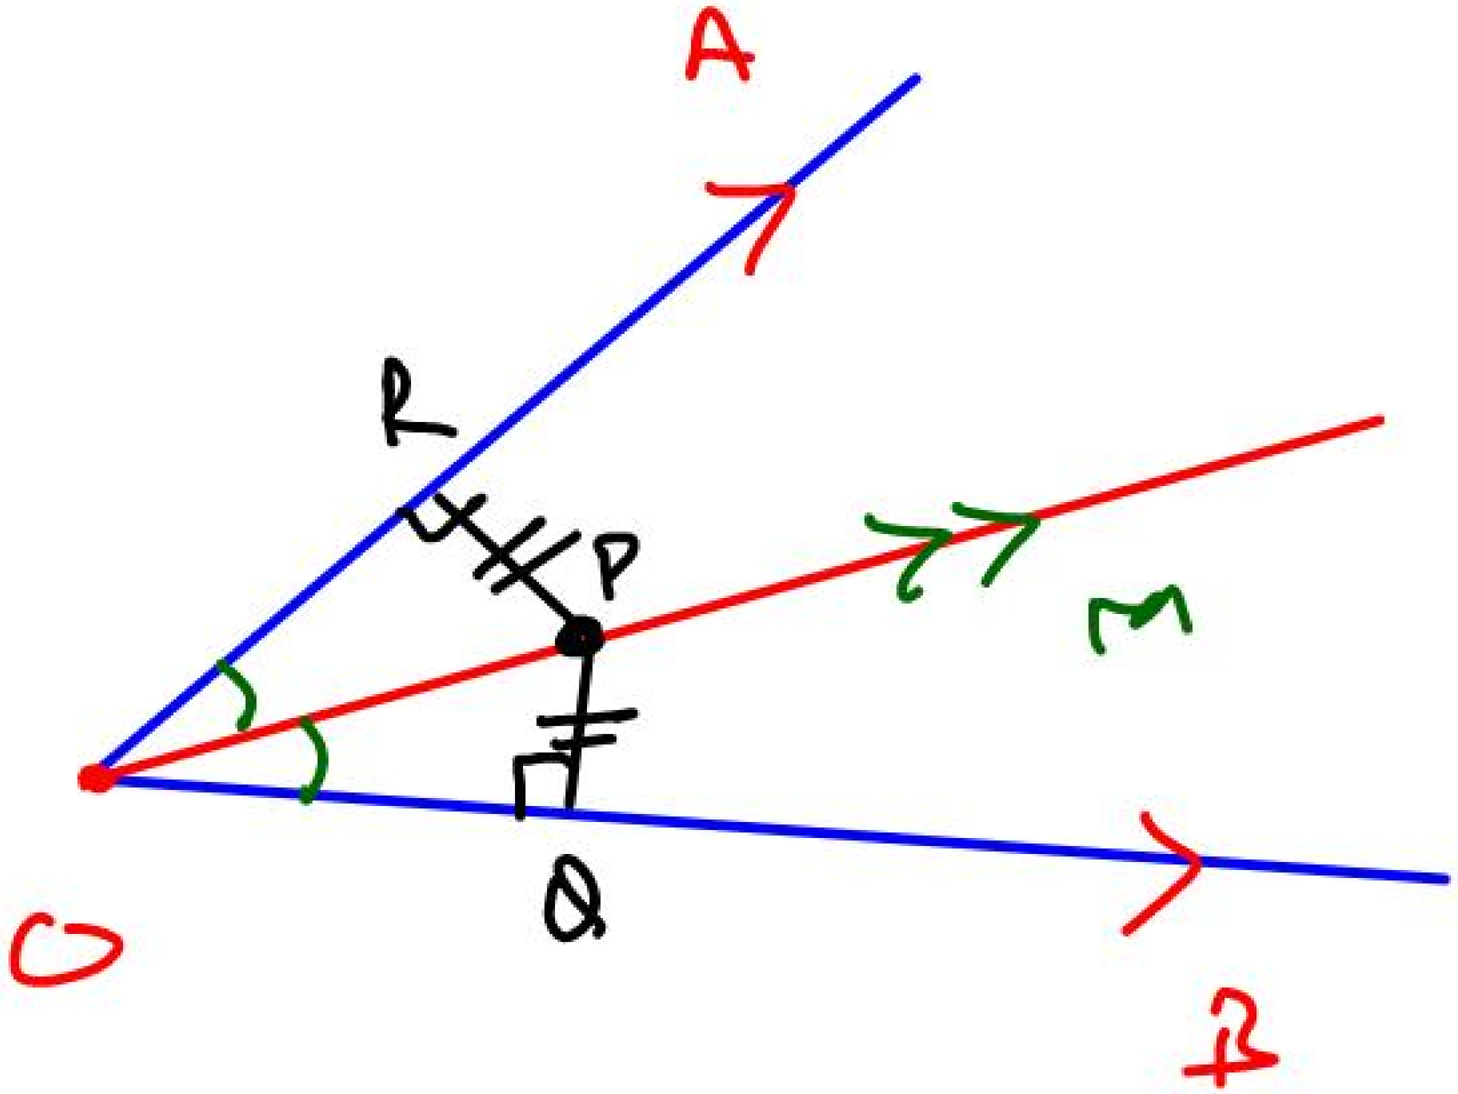


If AD is median

BD = DC

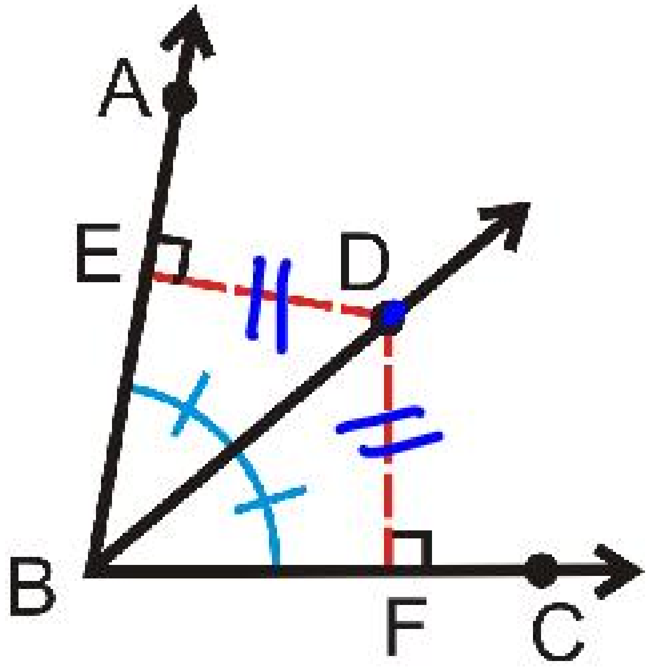
BYJU'S EXAM PREP

(3) Angle Bisector : The angle bisector of a triangle is a line segment that bisects one of the vertex angles of a triangle.

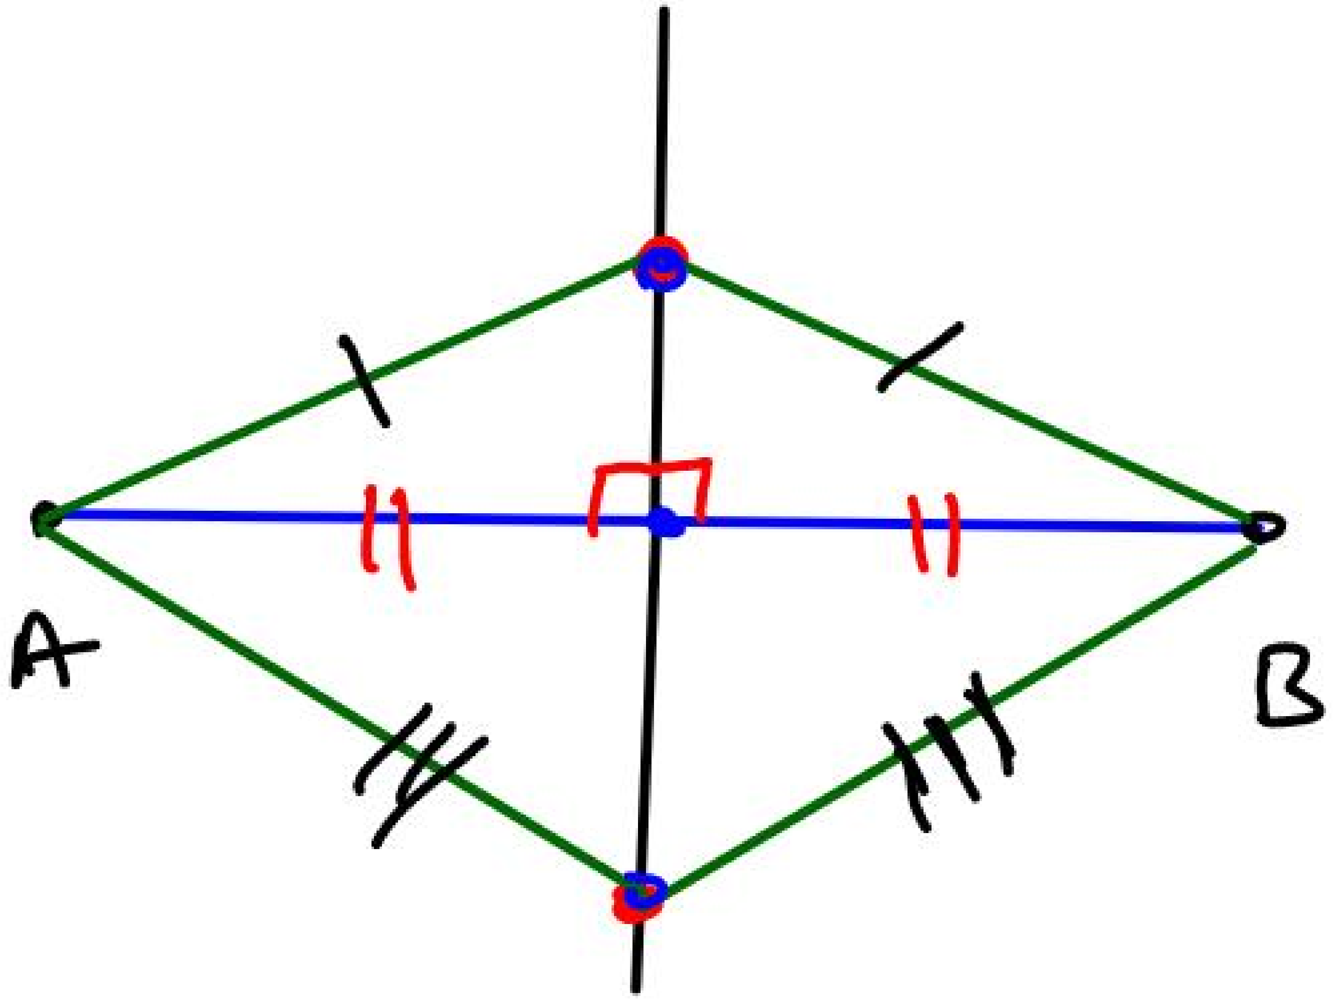


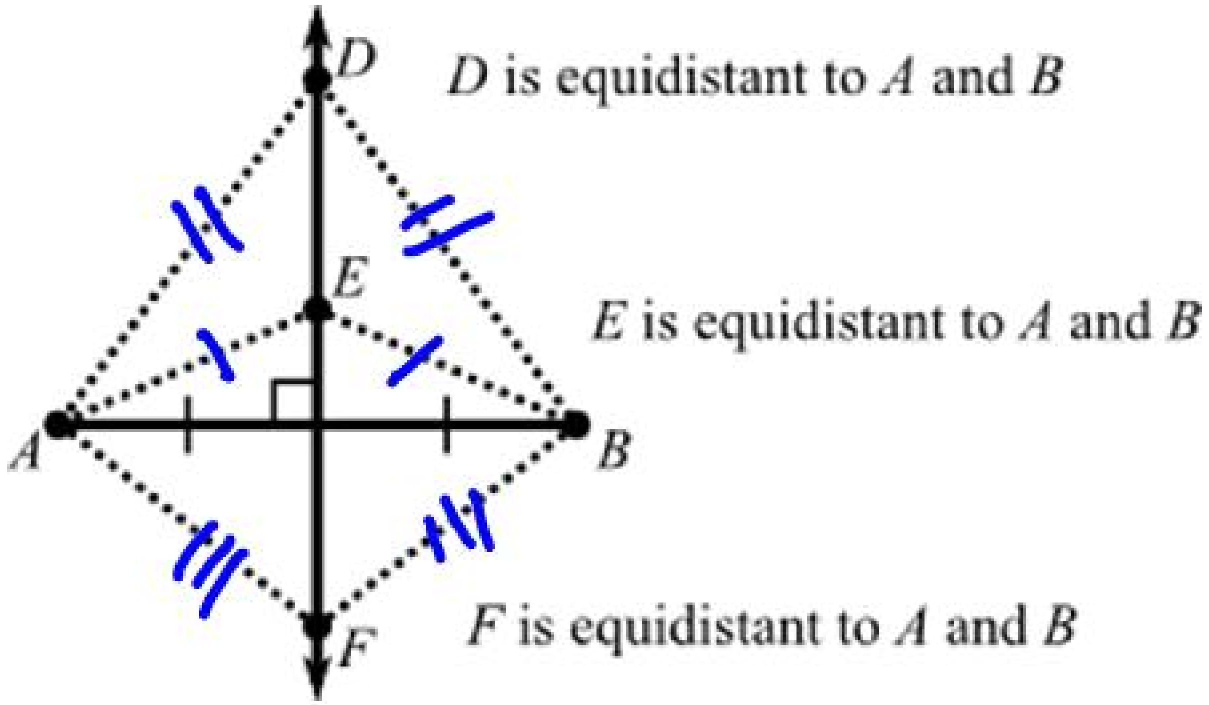
OM is Angle Bisector of $\angle AOB$

Angle bisector is equidistant from the sides containing the angle.



(4) Perpendicular Bisector : The perpendicular bisector of a side of a triangle is a line segment that is both perpendicular to a side of a triangle and passes through its midpoint.





Perpendicular bisector of a line segment is equidistant from the end points of that line segment.

Isosceles Triangle

In an isosceles triangle (where base is the side which is not equal to any other side):

– the altitude drawn to the base is the median and the angle bisector;

– the median drawn to the base is the altitude and the angle bisector;

– the bisector of the angle opposite to the base is the altitude and the median.

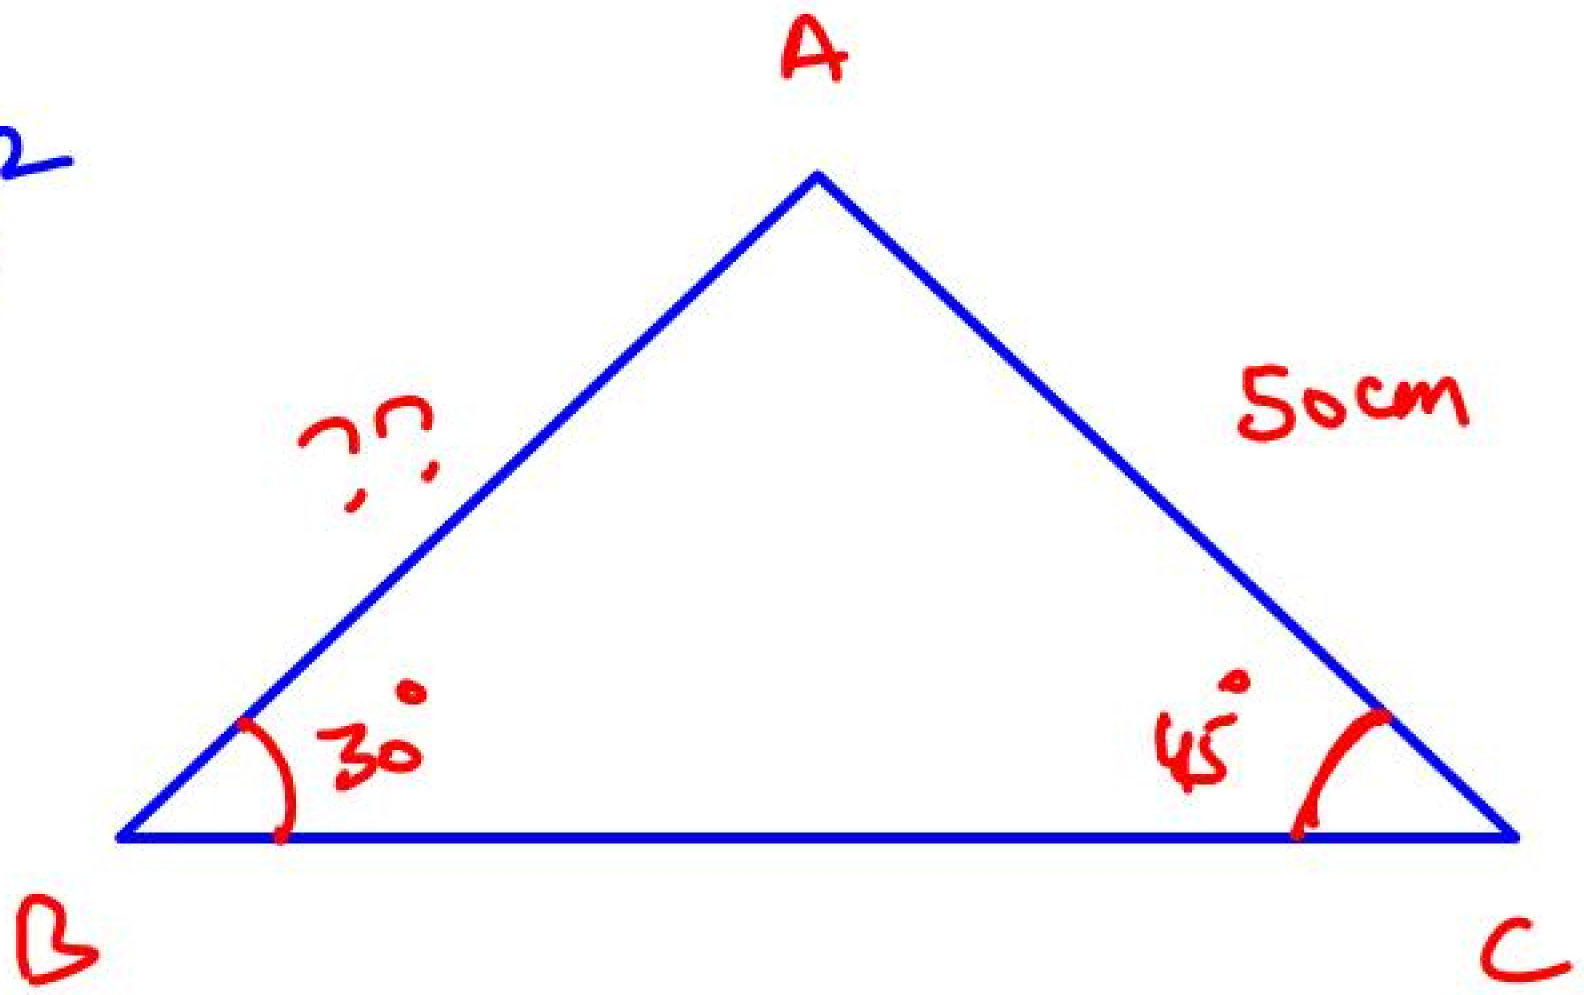
$$AC = \frac{100 \cdot \sqrt{2}}{\sqrt{3}}$$

eg 2



$$\frac{50}{\sin 30} = \frac{AB}{\sin 45}$$

$$100 = AB \cdot \sqrt{2}$$

$$AB = \underline{\underline{50\sqrt{2}\,cm}}$$

Eg5. If the angles of a triangle are 90°, 60° and 30°, then what is the ratio of the sides opposite to these angles?

$(a)\ \sqrt{3} : \sqrt{2} : 1$

$(b)\ 1 : \sqrt{2} : \sqrt{2}$

$(c)\ 2 : \sqrt{3} : 1$

$(d)\ 3 : 2 : 1$
